

### Sample Input:

emp.dat - Col1 is name, Col2 is Salary Per Day & Col3 is //  
no. of days worked

JOE	8000	3
RAM	6000	5
TIM	5000	4
BEN	7000	6
AMY	6500	7

### Sample Output:

EMPLOYEES	DETAILS
BEN	42000
AMY	45500

no. of employees are = 3

total pay = 128000

average pay = 42666.7

Ex. No.: 4a)

Date: 14/2/25

### EMPLOYEE AVERAGE PAY

Aim:

To find out the average pay of all employees whose salary is more than 6000 and no. of days worked is more than 4.

Algorithm:

1. Create a flat file emp.dat for employees with their name, salary per day and number of days worked and save it.
2. Create an awk script emp.awk
3. For each employee record do
  - a. If Salary is greater than 6000 and number of days worked is more than 4, then print name and salary earned
  - b. Compute total pay of employee
4. Print the total number of employees satisfying the criteria and their average pay.

Program Code:

```
BEGIN { print "EMPLOYEES DETAILS" }  
{ # salary should be greater than 6000 and days more than 4  
  if ( $2 > 6000 && $3 > 4 )  
  {  
    print $1, "\t\t", $2 * $3  
    pay = pay + $2 * $3  
    count = count + 1  
  }  
}  
END {  
  # action part  
  print "no of employees are =", count  
  print "total pay =", pay  
  print "average pay =", pay / count  
}
```

### Sample Input:

//emp.dat – Col1 is name, Col2 is Salary Per Day and Col3 is //no. of days worked

JOE 8000 5  
RAM 6000 5  
TIM 5000 6  
BEN 7000 7  
AMY 6500 6

### Output:

#### Run the program using the below commands

```
[student@localhost ~]$ vi emp.dat  
[student@localhost ~]$ vi emp.awk  
[student@localhost ~]$ gawk -f emp.awk emp.dat.
```

#### EMPLOYEES DETAILS

```
JOE 40000  
BEN 49000  
AMY 39000  
no of employees are= 3  
total pay= 128000  
average pay= 42666.7  
[student@localhost ~]$
```

### Result:

Thus the AWK script for finding average Employee pay has been programmed and executed successfully.
